

**PCP(e)**

**PCP(e)**

**NAME**

pcp — physical copy

**SYNOPSIS**

**pcp** file1 file2

**DESCRIPTION**

The first file is copied onto the second file using physical I/O directly from/to user's address space. Reads and writes are done in 3K word blocks. The mode and owner of the target file are preserved if it already existed; the mode of the source file is used otherwise.

If *file2* is a directory, then the target file is a file in that directory with the file-name of *file1*.

Copying a file onto itself is not allowed.

**SEE ALSO**

cat(I), pr(I), mv(I), cp(I), acp(e).
